

Week 6 Assignment

Due: Before the Week 7 class on Thursday, Oct. 8

Data: CreditDefaultData.csv

Target: Default (0=no, 1=yes)

ML Objective: Identify whether a customer is likely to default on their payments

Submit: Your solution *wk6_solution.py*, the output from your code *wk6_output.txt*, and the summary review *wk6_opinion_review.pdf*.

Data were extracted from 8,000 bank customers with their loan payment records.

This exercise is to build an ML model (decision tree) to identify customers likely to default on their loan payments. Please develop your solution following the approach used in the Week 6 class exercise. Use Cursor following the checklist "*Cursor_Project_Checklist*". Also set your Cursor Agent Model to "*Composer 2.5*".

Create your project folder using the zip file distributed for the class exercise:

"*Wk6_Class_Exercise.zip*." To keep the exercise and assignment separate, rename the project folder to "*Wk6_Assignment*".

This assignment is a larger version of the class exercise. Both use a binary target, but this assignment has many more predictors than 4. Follow the steps in the class exercise, and save your solution output to a text file "*wk6_output.txt*".

After you are satisfied with your solution, ask a *new* Cursor Agent to review your Python code and its output. I recommend using Grok 4.7 for the review. Have the review agent summarize the results, state what worked well, suggest improvements. Ask the review agent to save its review in the file "*wk6_opinion_review.pdf*".
